

## Hi There...

Just thought I'd posting something on the user page.

## Who the hell is this?

Who me? Oh, I'm just your average hardcore computer geek. Oh, well, maybe not that hard core. I am married and living in South Jersey in the US. I am the Chief Technology Officer for [PC Network Inc.](#) *(yeah the page sucks... I wanna replace it with a customized wiki once I get a breather... Or are you interested in helping out?)* I'm trying to establish more Open Source use in this Organization and our clients as well.

I used to be the CTO for the [newest shipyard in the US](#). Unlike a CIO I deal with the business end of the technolgy more and I am right in the trenches with the Network/Server/System Admins. I am also the head paranoid at the facility as I look after datasec.

## What the heck do you want here?

Well, I really like this project and I have implemented it in the office for my department as well as on my personal server at home. I'm hoping to learn a bit more about how all of the various things work in the system as well as contributing where-ever and however I can.

## That's nice but you got any skillz?

Some. I can hack my way through most languages although I rarely have enough time to code anything larger than your basic admimistration scripts. I can usually digest pretty complex code constructs and I know how to apply them not only in the apps but also for other purposes. I am also equally handy on the hardware and network side. It gives me a nice insight into the whole picture and not only the app side. Oh, and despite all of the pressures on my time I still steal enough of it to game. Right now the fixation is [Warhammer 40K:Dawn of War](#) although I've played the FPSs too. I used to hang out on Battle for Europe playing Day of Defeat...

## What's Hawt?

Recently, plugins. I've got one working all the way and another in the final debug stages. The plugins are geared towards extracting data from [Best Practical's Request Tracker](#) system. The first plugin basically, gets the total # of tickets OR Total Time in Hours per queue or for the whole install. The second one is designed to output a table that will show staff utilization with-in the current week. That's the one that's not working so good yet... Once I hammer them out more, I'll post them for y'all to try.

## Awright, enough already...

Yeah, my thoughts exactly. Feel free to drop by the [blog](#) or the [main page](#) and say "Hi."
