

So, I'm 199th in tikiwiki community.
Not as bad, though. =)

PEAR IDEAS

- One advice: do not use PEAR's XML-RPC - find another replace like <http://sourceforge.net/projects/phpxmlrpc/> or even better <http://scripts.incutio.com/xmlrpc/> Before XML-RPC I was thinking about entering PEAR, but now I'm really disappointed in this "community". As for PEAR's XML-RPC - it was the cause of major security holes in most popular PHP based systems.
- File'n'Replace (merge file:search and file:find_and_replace functionality)

<http://pear.php.net/bugs/bug.php?id=2707>

- RFE's

Should be on separate tab in package page. Feature can be committed to CVS in a separate QA branch

- BUGZ

Should have they own maillist for easy track and discussion ([pear-bugs//lists.php.net](http://pear-bugs/lists.php.net)).

H?> Actually iirc that it had been accepted by devs to open that list, but

H?> we haven't still seen that list started 😊

H?> Maybe that's something that we should push for again ?

ask toby or mike // php.net

- PATCH SYSTEM

Upload a modified source file and it will build a patch itself

Also Helgi Þormar said there is a patch tracker draft .

H?> There is no current state, well martin made some code which is in

H?> /include on pearweb, but it has to be changed a lot I guess, never

H?> looked at it.

TimeZone BUGS

If only I had enough time.. =)

Tiki is server<->client system. So it must be aware of different issues that can arise when switching from one time zone to another.

06:31 we had for a long time one day difference bugs plus timezonebugs

and here comes much more

06:30 If you can fix it without hack, it's ont of the longest-standing nobody-wants-to-fix-it things

06:30 you would probably find many complaints

06:31 if it interests you, dig in, make sure all is good and we'll give you a TikiMedal 😊
